Treating central nervous system and/or eye disorders comprises administering to a subject a composition comprising a compound that modulates a target gene or gene product, outside the blood-brain and/or blood-retina barriers.

Claim 19; SEQ ID NO 1; 91pp; English

This sequence encodes the human cyclic nucleotide gated channel alpha I protein. This cDNA may be targeted in the method of the invention for treating a disorder of the central nervous system (CNS) and/or the eye. CT the method comprises administering to a subject a composition comprising a compound capable of modulating a target gene or gene product in a compound capable of modulating a target gene or gene product in a compound capable of modulating a target gene or gene product in a compound capable of modulating a target gene or gene product in a designed form to be introduced into the calls or tissue of the CNS or eye blood-brain and/or the blood-retina barriers. It is also designed for cystemic administration or for administration by iontophoresis, or for systemic administration or for administration by iontophoresis, or for retrobulbar application or as eye drops. The compound, nucleic acid molecule or vector is useful for the preparation of a composition for treating, preventing and/or delaying a disorder of the CNS and/or the eye, e.g. related to angiogenesis and/or neovascularisation, retinal pignement epithelium (RPE), neurosensory retina and/or choroidea and wet age-related macular degeneration of advoscularisation of drugs or produugs. The nucleic acid molecule and produce for the validation of fows for the identification and isolation of dowstream genes, which compounds, drugs and produugs for the treatment of the disorder mentioned compounds, drugs and produugs for the treatment of the disorder mentioned compounds, drugs and produugs for the treatment of the disorder mentioned compounds, drugs and produugs for the treatment of the disorder mentioned compounds, drugs and produugs for the treatment of the disorder mentioned compounds, drugs and produce for the wolldation of dowstream genes, which respond to modulation of a gene comprising the nucleic acid molecule or the disorder cited above, which may included Alzheimer's anxienty, chronic pain, retinal blastoma, primary retinal disorder or

```
The invention relates to isolated polymuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGT) primers, ollgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed can be separately in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders involving abberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations trains responsible for genetic disorders or other traits to assess biodiversity.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher uckaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-
                                                                                                                                                                            ô
                                                                                                                                                                                                                                         142
                                                                                                                                                                                                                                                                       468
                                                                                                                                                                                                                                                                                                      202
and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more
genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ATGGACAAAGCATATATTTACAGAGTTATTCGAACAACTGGATACTTGCTGTTTATTCTG 1154
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ACCAACTACCCCAATATGTTCAGGATTGGGAACTTGGTCTTGTACATTCTCATCATCATC 981
                                                                                                                                                                                       The present relates to a method for identifying a compound for treating urological disorders e.g., urinary incontinence including overactive/oversensitive bladder, overflow urinary incontinence, stress urinary incontinence caused by disfunction of the bladder, urethra or central or peripheral nervous system, prostatitis, benign prostatic hyperplasia, cancer of the prostate or kidney disorders. The method is also useful for modulating hyperplasia in a cell and treating a subject having a present sequence is human CNG channel alpha 3 potassium channel (KCNQ2) DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GATACCAACAGGCTGTGGCAGCATTACAAGACGACCACGCAGTTCAAGCTGGATGTTG 801
                Identifying a compound for treating urological disorders, for example urinary incontinence by assaying the ability of the compound to modulate the nucleic acid expression or polypeptide activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TTAATTGGTCAGATGAGAGATGTGATTGGAGCAGCTACAGCCAATCAGAACTACTTCCGC

```
The invention relates to compositions and methods for identifying G protein-coupled receptor (GPCR), ligands and compounds that modulate GPCR mediated activities. The invention also provides an host cell comprising first and second nucleic acids with promoters that encode exogenous G protein-coupled receptor and cyclic nucleotide-gated (CNG) channel respectively. The host cells are useful for identifying agents that modulate an activity mediated by a GPCR. The present sequence is rat CNG channel alpha subunit mutant encoding DNA

```

The invention relates to compositions and methods for identifying G protein-coupled receptor (GPCR), ligands and compounds that modulate GPCR emediated activities. The invention also provides an host cell comprising first and second nucleic acids with promoters that encode exogenous G New host cell comprising first and second nucleic acids with promoters that encode exogenous G protein-coupled receptor and cyclic nucleotidegated channel, respectively, useful for identifying agents that modulate GPCR activity. "CNG channel alpha subunit ild-type protein"

```

displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences 8X688888

Sequence 526 BP; 174 A; 119 C; 99 G; 134 T; 0 U; 0 Other;

/mote="Organ: Eye; Vector: pCMVSPORT6; Post-mortem iris tissue was pooled from 10 individuals ranging in age from 4-80 years and RNA was extracted. From this pooled sample an aliquot of 60ug of total RNA yielded 2.170 of mRNA. A directionmally cloned cDNA library in the pCMVSPORT6 vector was constructed at Life Technologies, essentially following the protocols of the SuperScript Plasmid System

Justes "Organ: Eye, Vector: pCMVSPORT6, Post-mortem iris tissue was pooled from 10 individuals ranging in age from 4.80 years and RNA was extracted. From this pooled sample an aliquot of 60ug of total RNA yielded 2.17ug of mRNA. A questionally cloned cDNA library in the pCMVSPORT6 vector was constructed at Life Technologies, essentially following the protocols of the SuperScript Plasmid System full details of which are contained in the manufacturer's instruction manual (http://www.lifetech.com/), First strand synthesis was carried out using a Not I
  F5'-redactagratcatedeacedececec(T)15-3']. Not I/blunt end inserts were cloned into the Not I/EcoR V sites in the vector. BST analysis was performed on the unamplified library at the NIH Intramural Sequencing Center (NISC)."

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  Jone = "Coping the protein of the protein of the last family contains Sodium, Potassium, Calcium ion channels. This family contains Sodium, Potassium, Calcium ion channels. This family is 6 transmembrane helices in which the last two helices flank a loop which determines ion selectivity. In some sub-families (e.g. Na channels) the donain is repeated four times, whereas in others (e.g. K channels) the protein forms as a tetramer in the membrane. A bacterial structure of the protein is known for the last two helices but is not the Pfam family due to it lacking the first four helices."

   Natius norvegicus mRNA for cyclic nucleotide-gated cation channel beta subunit.

AJ000496.1

AJ000496.1

GI:2292985

beta subunit, CNG4.1 gene, cyclic nucleotide-gated cation channel.

   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A directionally cloned cDNA library in the pCMVSPORTE vector was constructed at Life Technologies, essentially following the protocols of the SuperScript Plasmid System full details of which are contained in the manufacturer's instruction manual (http://www.lifetech.com/). First strand synthesis was carried out using a Not I
  [5.-pgaCTAGTTCTAGATCGCGAGCGGCCCCC(T)15-3']. Not I/blunt end inserts were cloned into the Not I/EcoR V sites in the vector. EST analysis was performed on the unamplified library at the NIH Intramural Sequencing Center (NISC)."
